                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exotoxin A (ETRA), a virulence factor and secreted protein encoded CC by the toxA gene (see AAV61784). The invention employs a group of CC membrane penetrating proteins, of which ETA is an example, to CC carry a variety of therapeutic agents across the cellular membrane CC carry a variety of therapeutic agents across the cellular membrane CC card, peptide, peptide nucleic acid, (single chain) antibody, or CC control of a enkaryotic promoter (e.g. the cytomegalovirus control of a enkaryotic promoter (e.g. the cytomegalovirus control of a enkaryotic promoter (e.g. the cytomegalovirus conding protein, single chain antibody, tumour suppressor, it CC encodes an antisens molecule that targets an oncogene or viral CC encodes an antisense molecule that targets an oncogene or viral CC ertaining its ability to transport molecules across membranes, or CC by introduction of a free cysteine in domain III (see AAW61787). CC conjugates of ETA, specifically apptide nucleic acids (see AAW61787). CC conjugates of ETA, specifically peptide nucleic acids (see AAW61787). CC administered, thereby reducing toxicity, and provide effective targetting of an agent to a specific point within a cell.
                                                                                                                                                            В

                                                                                                                                                                                                                                                           Plasmid pVCPE/2 was made by replacing the 105bp PpuMI/EcoRI fragment of pVC45DF+T (containing the Pseudomonas Exotoxin coding region) with a 46bp DNA fragment (AAQ41718) encoding an in-frame duplication of PE codons 604 to 613 flanked by unique restriction sites. This construct is used for generating full-length molecules of PE with the deletion of residue 553 resulting in an inactivated toxin domain (AAQ41719) fused to chosen protein segments between

Example 8 describes the construction of pVCPE/2-Ma. pVCPE/2-Ma was made by ligating into the XmaI site of pVCPE/2 a 48 base pair DNA fragment encoding amino acids 55 through 67 (AAQ36020). This construct expresses in E.coli full-length PE with MI amino acids 55 through 67 inserted between PE amino acids 604 and 605 (AAQ38394). One may replace the ompA signal sequence with the promoter/ribosome binding site as described for pVC-PEMI-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 7 describes the construction of pVCPE/2 (pVC45DF+T/2).

pVCPE/2 was made by replacing the 105 base pair PpuMI/ECORI
fragment of pVC45DF+T with a 46 base pair DMA fragment encoding an
inframe duplication of PE codons 604 to 613 flanked by unique cloning
sites. This construct is used for generating full-length mols. of PE
with the deletion of residue 553 resulting in an activated toxin
domain (AAQ36019) fused to protein segments of choice between PE
codons 604 and 605. One may replace the ompA signal sequence
with the promoter/ribosome binding site as described for pVC-PEMI-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SWSLMWLVPIGHEKPSNIKVFIHELNAGNQLSHMSPIYTIEMGDELLAKLARDATFFVRA 180

The primers used in the amplification reaction had sequences AAQ41722 and AAQ41723. The construct express in E.coli full-length PE with MI amino acids 15-106 inserted between PE amino acid 604 and 605 (see AAQ41724).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant DNA encoding bacterial toxin-antigen conjugates - are useful as vaccines against viral infections, tumours and parasites

Example 9 describes the construction of pVCPE/2-M1:15-106. pVCPE/2-M1:15-106 was made by subcloning a PCR-amplified DNA fragment encoding M1 amino acids 15 through 106 into the Xmal site of pVCPE/2. The sequence of the oligonucleotide primers used to amplify the M1 segment are those shown in AAQ38395-96, respectively. This construct expresses in E.coli full length PE with M1 amino acids 15 through 106 inserted between PE amino acids 604 and 605 (AAQ38397).
                                                                                                                                                         240

The resulting construct expresses in E full-length PE with MI amino acids 55-67 inserted between PE ami
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acid 604 and 605 (see AAQ41721).

The PCR fragment was cloned into plasmid pvc45DF+7 (containing Pseudomonas Exotoxin sequence). In the resulting plasmid, pVC-ompA-PEGAG, the binding and translocation domains of PE were fused to the gag gene of HIV-1. The fusion contains an own leader.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
Bacterial toxin-antigen protein conjugates - to elicit cytotoxic T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human papilloma:virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 26 describes the construction of pvC-ompA-PEGAG.

The HIV GAG gene was obtained from plasmid HIVpBR322 by
CC Pick with oligonucleotide primers which added a SacII site
CC adjacent to the ATG codon of GAG to give the sequence of
CC AAQ38412, and a SacI site immediately after the termination
CC codon at the 3' end to give the sequence shown in AAQ38413.

CC rhe PCR fragment was digested with SacII and ligated to the
CC plasmid pvC45DP+T, which had been digested with EcoRI, the 5',
CC overhang filled in by Klenow fragment, and digested with SacII.
CC overhang filled in by Klenow fragment, and digested with SacII.
CC overhang filled was named pvC-ompA-PEGAG (AAQ38414) and was
CC verified by a partial sequence at the SacII junction. This
CC construction fuses the binding and translocation domains of PE
CC compA leader sequence. Alternatively, any vector contg. the complete
CC coding region for HIV-I GAG can be used with these oligomers to generate
CC the HIV GAG gene by HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ωy

A control plasmid was constructed which encodes a T7 polymerase driven gene fusion consisting of PE amino acids 2 to 414 followed termination codons. pVC-PEMI-2 was digested with SacII and EcoRI remove the M1 sequence. The vector was gel purified and ligated tan oligonucleotide that builds back PE codon no. 414 followed by termination signals shown in AAQ37893. The resulting construction was named pVC-PEBT (AAQ37108).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bacterial toxin-antigen protein conjugates - to elicit cytotoxic T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  matrix protein) was subcloned into BS-PE, a plasmid constructed by inserting a 1.3kb Nruf/SacII fragment of plasmid pVC45-DF+T containing the domain I and II coding regions of Pseudomonas exotoxin into pBluescript II SK restricted with HincII and SacII. The PE-derived portion of the hybrid protein allows internalisation of the protein by an antigen-presenting cell. The hybrid protein is then processed and an antigenic segment (i.e. the Influenza A virus matrix protein) is presented on the cell surface where it elicits an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          An

CC Example 4 describes the subcloning of PEMa from BS-PEMa-1 into CC BVC45DF+T. The PEMa insert (AAQ37890) was prepd. by restricting CC BS-PEMA-1 with SacI and removing the 3' overhang by treatment with CC BS-PEMA-1 with SacI and removing with ApaI and gel purifying. CC pVC45DF+T was restricted with EcoRI and the 5' overhang filled in CC with Klenow enzyme treatment. It was subsequently restricted with CC ApaI and gel purified. The vector and fragment were ligated together, CC and the resulting construction was named pVC-ompA-PEMa-1. CC The ompA signal sequence was removed from pVC-ompA-PEMa-1 by CC digestion with XbaI and HindIII. An oligonucleotide fragment contg. The Try promoter, ribosome binding site, initiation sequence and a build-back of the 5' end of the PE coding region (AAQ37891) was CC build-back of the vector. The resulting plasmid construct was named CC pVC-PEMa-1 and encodes a T7 polymerase-dilven gene fusion consisting CC of PE amino acids 2 through 414 joined to influenza Ml amino acids CC T to 68 (Ma) (AAQ37892).
                                                                                                                                                                                                            RESULT 1

The toxins are cross-linked through the free SH group of their unpaired cysteine residues to binding mols. (including monoclonal antibodies, fragments and other ligands) to form immunotoxins, and these immunotoxins do not bind to the cell surface receptors which are bound by the native cytotoxin. However, when the cross-linker is cleaved and the binding mol. is released, the cytotoxin regains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Searched:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 OM protein - protein search, using sw model
     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score
